First 100,000 zeros: the differences have the size of the noise (χ^2 per bin 1.050, expected 1.054)
expected error of the formula $T^{-1/2}$
Conrey and Snaith 2008 (reported)
our data − formula (averaged over heights)
pure noise (model + error of the bin, 2,000 simulations)
difference data − formula
